

Football Quiz Platform — Project Status

Snapshot as of August 1, 2026

What This Is

A web app for football coaches to build film-study quizzes with annotated play images (drawn arrows, circles, routes on top of screenshots), distribute them to players via access codes, and grade/review results. Flask + PostgreSQL backend, React + TypeScript frontend, Fabric.js-based image annotation tool.

Live Deployment

The app is deployed and reachable right now:

Frontend (players & coaches)	https://football-test-app.netlify.app
Backend API	https://football-quiz-backend.onrender.com/api
Backend health check	https://football-quiz-backend.onrender.com/api/health
Image/file storage	Cloudflare R2 (S3-compatible bucket)
Database	Render-managed PostgreSQL
Source repo	github.com/Beaudry13/football-test-app

Features Complete

Core platform

- Coach accounts (register/login), quiz CRUD, question builder (multiple choice, true/false, written)
- Image annotation tool: upload or paste a screenshot, draw arrows/lines/circles/rectangles/text/freehand curves on top, edit an already-placed shape's color/width/dashed style, drag a line or arrow's endpoints individually to reshape it
- Roster upload (CSV) and per-quiz access-code generation for players
- Player quiz-taking flow: join with access code + name, answer questions, submit
- Coach grading dashboard for written answers, with per-player results
- Player review-after-submit: players see a per-question breakdown (their answer, correct/incorrect, coach feedback) right after submitting, and can revisit later via a bookmarkable results link — works even after the access code expires
- CSV and PDF export of a quiz's results from the coach dashboard

Hardening / quality

- Backend: 100+ tests covering auth, quizzes, grading, roster edge cases, rate limiting, access-code security (cryptographically random codes), N+1 query fixes, consistent error handling
- Frontend: Vitest + React Testing Library, 86 tests covering API client, auth, the annotation canvas, and core page flows
- Cloud file storage (Cloudflare R2) replacing local disk, so uploaded images survive backend redeploys
- Orphaned-file cleanup: deleting a quiz now also deletes its images from storage

Most Recent Work: Live Deployment + Annotation Tool Bug Hunt

This session covered the first real deployment (R2 + Render + Netlify, walked through live together) and then a chain of real bugs found by actually using the deployed annotation tool — each was root-caused and fixed, not patched around:

- Images rendering as a black box → missing CORS handling on cross-origin canvas image loads
- Only part of a large image rendering → Fabric's internal image scaling was unreliable; now pre-rendered to exact size before handing to Fabric
- Image rendering in the wrong corner → Fabric objects default to center-origin, not top-left, if not set explicitly
- Background photo disappearing after save + reload → reloading saved annotations was silently wiping the background image; now re-applied after load
- Large pasted screenshots rejected for size → added automatic client-side resize/re-encode before upload
- Shapes duplicating while being dragged → toolbar wasn't switching back to "Select" after placing a shape
- Added: click an already-placed shape to edit its color/width/dotted/fill
- Added: drag either end of a line/arrow directly to reshape it, instead of only a resize box
- Fixed: a plain click near an endpoint was deleting the shape and breaking delete afterward
- Polish: replaced the resize box with two small persistent dots at the endpoints (pushed live today, pending final user confirmation in-browser)

Pending / Not Started

From the original post-launch feature shortlist, explicitly deprioritized by the user ("push these back further, not urgent for fall camp"):

- Question bank / reusable question library across quizzes
- Timed quizzes

Immediate next step: confirm in-browser that the endpoint-marker visual change (dots instead of a resize box on lines/arrows) looks and behaves correctly — no box, dots follow the shape when dragged, dots still reshape it when dragged individually.

How to Pick This Back Up

Working directory: C:\Users\Administrator\Desktop\football-quizz-platform. Git repo, pushed to GitHub, auto-deploys: pushing to master triggers a new Render backend deploy and a new Netlify frontend deploy automatically. Full step-by-step deployment reference (R2/Render/Netlify setup) lives at docs/DEPLOYMENT.md in the repo. Backend tests: `cd backend && .venv/Scripts/python -m pytest -q`. Frontend tests: `cd frontend && npm run test -- --run`.

Generated by Claude Code as a working handoff summary.
